

Is That Really A Fruit?

A in-depth look at fruit and
what they really are

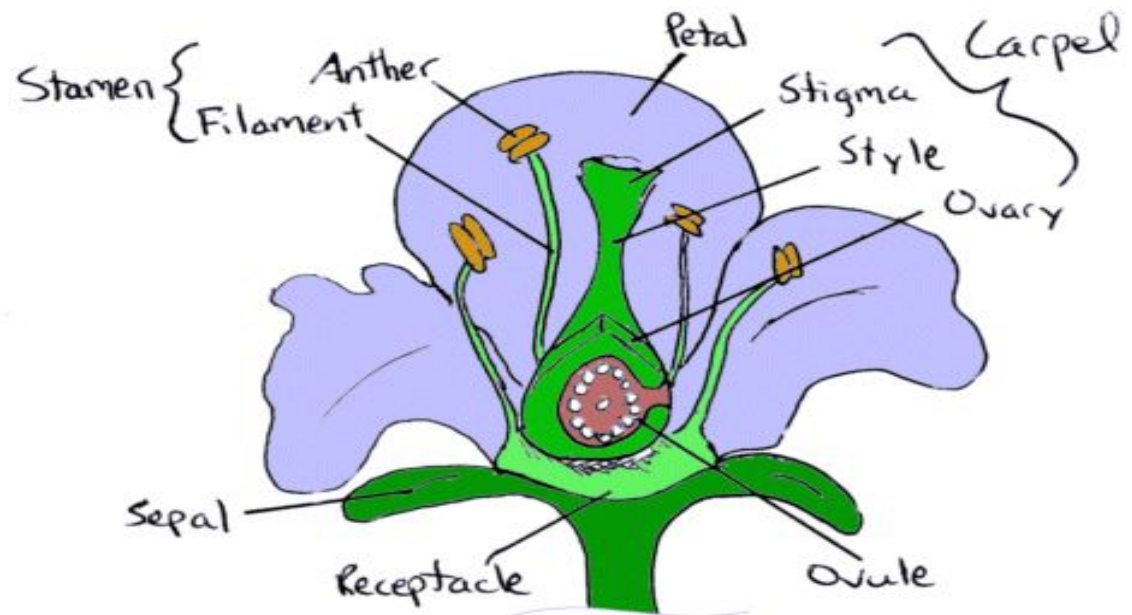

Everyone knows that an apple is a fruit, but what about hazelnuts or an eggplant. Well they both come from plants but one's a nut and the other is a vegetable, right?

Actually **NO**, they are all considered fruit to botanists. They see a fruit as a ripened plant ovary!

So how does a fruit really form?

- After a fruit is fertilized (usually by bees) its ovula begins to form into a seed.

Now draw and label your own
flower, like the one just seen!

Types of Fruits

- There are many different types of fruits like simple ones, such as:
 - apples
 - beans
 - bananas

- Others are more complicated and are made from multiple tiny fruits like pineapple.

The development of a plum from stem to fruit...
